Abstract (en)

[origin: WO0145948A1] The invention relates to a sling device for exchanging a rotation-symmetrical component in a printing machine which is mounted on a bearing. The aim of the invention is to provide a sling device that allows to reliably sling a rotation-symmetrical component and to reduce set-up times. To this end, the sling device is provided with a ball-bearing sleeve (1) that carries at least one ball (2) that is firmly held on the periphery of the sleeve. Every ball (2) is mounted on the periphery of the ball-bearing sleeve (1) so that it can protrude or be retracted. The sling device is further provided with an actuator device (4) that is disposed on the ball-bearing sleeve (1) and that is functionally linked with every ball (2) by means of a pin that can be displaced within the ball-bearing sleeve (1).
