Abstract (en)
[origin: WO0125890A1] A device for modifying the touch sensitivity of faces or panels that are capable of registering touch by pressure. The device, for example, made in the form of a flexible sheet having a substantially smooth first surface and an opposite second surface provided with pointwise projecting irregularities, can be placed with the second surface against touch-sensitive computer screens and the like and transmit to the screen pressure on the first surface via the points on the second surface with a greater contact pressure at the contact points.
