Abstract (en)

[origin: DE10114269C1] Production of a hot strip comprises inserting liquid steel between two opposing rotating casting rollers in a two roller thin strip casting device; solidifying the strand skins to a defined thickness; and deforming to a final thickness. The strand skins are pressed together to form a hot strip with variable material cross-sections. An Independent claim is also included for a device for producing a hot strip. Preferred Features: The strand skins are pressed together in transition regions in point-form, line-form and/or planiform.
