Abstract (en)
[origin: EP1243708A2] It is characterised in that the means for fitting the body of the tap (6) to a base surface (7) are made up of a pair of swivelling bodies (3) that can be moved over the length of a threaded stem (2), and are able to swivel between a substantially vertical position and a substantially horizontal position, said threaded stem (2) being provided with an upper recess (5) to make the stem rotate in relation to tap body (6) using a suitable tool, with access to that recess being possible through an orifice (8) provided in the upper part of said tap body (6). This permits fitting of the tap to be carried out from its upper part. <IMAGE>
