Abstract (en)

[origin: EP1243737A2] The device is for fixing a frame in a wall aperture, where the frame (2) comprises a door frame (5) and a second corresponding, completing counter frame (6), with fixture points (7) in the door frame pointing to the opening edge of the light structure wall. In the fixture points, a rotary penetrating anchor formed as a tab (8) is fixable. The tab and the fixture point work in conjunction with one another via a bayonet-type closure. The fixture point itself is pot-shaped, with an elongated aperture running in its base, through which hook components (12.1) (12.2) formed on or stamped out of the tab are insertable. The hook components, as the result of the pivoting of the tab, engage behind the lateral remaining base areas of the pot.
