Abstract (en)

[origin: WO0150124A1] A method for the selective variation of a multi-variable molecular synthesis to optimize a reaction product functional property, including the steps of: constructing a first order library of functional property output data obtained by reacting all first order library input variable combinations for the multi-variable synthesis and measuring the functional property for every reaction product, wherein the first order library input variable combinations include all values selected for each variable taken one at a time; ordering the values for each input variable according to their effect upon functional property optimization; constructing a second order library of functional property output data obtained by reacting a set of second order library input variable combinations coarsely sampled two variables at a time from the ordered input variables and measuring the functional property for every reaction product; and interpolating among the functional property output data for functional property optimization.
