Abstract (en)
[origin: EP1245771A1] The hinge (10.3) has a horizontal position adjustment device comprising an adjustment screw in contact with the engagement section of the hinge flap (15) extending into the gap between the frame and wing. The screw is supported at right angles by a frame member extending at right angles to this gap. The adjustment position of the screw is held in place by the pressing of the hinge flap against this frame member. The hinge comprises a part (11.3) for securing to the frame, a part for securing to the wing pivotally connected to the frame part via a pivot bearing axle (13), and a hinge flap with a bearing hole (14) for receiving the pivot bearing axle. The hinge has a horizontal position adjustment device for altering the distance between the bearing hole and a frame member extending at right angles to the gap between the wing and frame.
