Abstract (en)

A laser beam is directed to an optical recording medium such as a DVD-R to successively form thereon marks of a length corresponding to data with a spacing disposed therebetween. A Q value or the amount of reduction in time causes the rise time of laser irradiation to be delayed with respect to the scheduled rise time at least after a spacing equal in length to the mark of the shortest length employed for recording. The Q value satisfies the following equation (1) expressed in terms of the relationship between the recording speed n and an asymmetry. That is, $(0.54 \times \text{Asymmetry} - 1.1) / n \leq Q \leq (0.54 \times \text{Asymmetry} + 0.1) / n$ (1) where the asymmetry is the ratio of an amplitude of the shortest mark to that of the longest mark of the recorded marks.
