Abstract (en)
[origin: WO0151383A1] A method of manufacturing an infusion package (10) comprising a porous-walled container (12) for an infusible substance and a support for the container by means of which the container can be mounted on a rim of a drinking vessel. The method comprises (i) making cuts in at least one web of a semi-rigid material in a direction transverse to the web length to define a plurality of support members (14), each cut defining a first end (16) of one support member and a second end (20) of an adjacent support member such that the first end includes a projection (18) and the second end includes a recess (22) the cutting of which recess produces the projection; (ii) bringing two such support members into opposed relationship with the first end of one of the support members disposed opposite the second end of the other of the support members; (iii) positioning an end region of the container between the opposed support members; and (iv) securing that end region to the support members.
