Abstract (en)
[origin: WO0150001A2] The invention relates to an internal combustion engine, in particular of a motor vehicle, in which fuel can be injected into an intake manifold or into a combustion chamber during the warm-up process. A control device for determining a warm up factor (fWL) below an operating temperature of the internal combustion engine is provided, in order to increase the injected quantity of fuel. The warm up factor (fWL) is determined by the control device from a basic factor (fG) and a load-sensitive factor (fLA).
