Abstract (en)
[origin: WO0152508A1] A wireless communication device (101) is provided with a keypad (134) to allow a user to enter data, such as alphanumeric sequences, timing and delay information, associated with a destination. A data storage (118) communicatively coupled to the keypad (134) stores the information entered by the user. A processor (112, 114) is communicatively coupled to the keypad (134) and to the data storage (118). In operation, the user uses the keypad (134) to enter information for storage in the data storage (118). When a call is to be placed to the destination, the user again uses the keypad (134) to select information stored in a particular addressable memory location (120) within the data storage (118). The processor (112, 114) is responsive to a command from the user to retrieve the selected information and to transmit the retrieved information from the wireless communication device (101) to the destination.
