Abstract (en)

[origin: EP1247462A2] Device comprises a first measurement device with a measurement signal indicating the density of the fiber stream, a second measurement device with a measurement signal indicating the density and structure of the stream and an analysis device that indicates the structure of the fiber stream, in particular reporting any variations from an average fiber structure. An Independent claim is made for a method for determining the density and structure of a tobacco fiber stream and reporting any significant variations from the average fiber structure.
