Abstract (en)

[origin: EP1247926A2] The invention relates to an assembly of revolving cylinder lock and key (10), whereby the lock consists, among others, of a cylinder stator (1) and a rotor (2) which is rotatable therein about the longitudinal axis of the cylinder stator (1) and of which the rotation in the locking position is prevented in the usual way by a series of radial locking pins, which due to the teeth of the key may be released from their locking position, characterised in that, apart from above said locking pins, additional blocking means are provided, whereto above said key shows a rib (9) extending longitudinally, having such cross sections that the key (10), completely inserted into the stator, pushes said additional blocking means in the release position, thus enabling the rotation of the rotor in the stator. <IMAGE>
