Abstract (en)  
[origin: WO0152627A2] The invention relates to a method for using a centrifugal device for scattering fertilizer, comprising a reservoir with a metering mechanism, and centrifugal plates which are located under said reservoir, which each have two throwing shovels and which are driven in rotation. A shorter throwing shovel and a longer throwing shovel are located on each centrifugal plate in order to produce an at least approximately triangular scattering pattern with a throwing width that is at least approximately twice the working width. The shorter throwing shovels of the two plates essentially only scatter material over the area of the working width, while the longer throwing shovels essentially scatter material over the side area adjoining the working width with a small area in which the scattering sections formed by the long and short throwing shovels overlap.
