Abstract (en)
[origin: WO0153164A2] The invention concerns a device comprising a membrane valve consisting of a part (15) forming said valve seat, wherein is provided a conduit (25, 26) circulating the product contained in the container (2, 50), and of a membrane (16) made of an elastically deformable material, tightly engaged on said part (15). The invention is characterised in that said part (15) has a general conical part, and a cross-section flaring out in the direction of the orifice (24) allowing the product to flow beyond said valve; said membrane (16) has a generally conical shape corresponding to that of said part (15), and can be tightly fitted thereon, and said membrane (16) and said container (2) comprise support means (5, 10, 11, 28, 30 to 32) to maintain the membrane (16) in its tight-fit position on said part (15).
