Abstract (en)
[origin: WO0153606A1] The invention relates to a cavity filling element which can be prefabricated and which is provided for rails, particularly for those of streetcars. The cavity filling element primarily consists of a body made of inorganic material which, preferably by pressing or gluing, can be inserted into rail cavities while inserting elastic insulating material between the rail head and the rail base. The cavity filling element is constructed as a one-piece element and, with the exception of the side facing the stem of the rail, is provided with a sheathing made of an elastic insulating material such as polyolefin.
