Abstract (en)
A strut for supporting services between parallel spaced apart I-beam flooring joists is described. The strut has a main section adapted to fit transversely between the two joists and has two end regions which extend beyond and above the main section for resting on the joists, so that the main section is supported so as to extend between the two beams below or in line with the upper faces of the joists. This enables services such as cables, ducting or pipes to be supported below the floorboarding carried by the joists. A number of such struts are located at intervals along the length of the joists in the form of the rungs of a ladder to enable lengths of cables, ducting or pipes to be supported below the floorboarding.
