Abstract (en)
[origin: EP1251223A1] The core-side closure component is displaceable by a broad-side profiling of the key in a cavity crossing the rotary seam of the cylinder core. In the outward direction of the key the closure component, it is spring-loaded and has a control projection extending sideways into the key channel. In the housing-side cavity part, there is a housing-side closure component (14) spring-loaded in the direction of the core, whereby the spring force of the core-side spring (17) is greater than that of the housing-side spring (18). The cavity (13) is positioned eccentrically diametrically and has a non-round cross-section, in which the closure components are non-rotatably located.
