Abstract (en)

[origin: EP1251236A2] An industrial roller door comprises a plurality of lamellas which are pivotably joined to one another, and have a double-walled structure formed by walls incorporating sections with U-shaped grooves for connector strips along their longitudinal edges. A compressed elastomer element is located between the surfaces of the connector strips and these grooves. <??>An industrial roller door comprises a plurality of lamellas (21) which are pivotably joined to one another, and have a double-walled structure formed by walls (211, 212) incorporating sections with U-shaped grooves (2111, 2121) for connector strips (213) along their longitudinal edges. A compressed elastomer element (214) is located between the surfaces of the connector strips and these grooves. <??>Independent claims are also disclosed for: <??>(1) a lamella forming a part of the proposed industrial door; and <??>(2) a method for producing such a lamella.
