Abstract (en)
[origin: FR2823608A1] The sealing joint (10) is designed to ensure a seal around an electric cable (C). The cable can be of different section. The joint includes a block which is an elastically deformable seal. The sealing part has a succession of different section coaxial slots (50a,50b,50c) and ribs made from an elastically deformable material which are parallel to each other and perpendicular to the alignment axis of the slots. The ribs are formed to overlap each other. The slot (50a,50b,50c) sections are decreasing from an internal face of the block, but do not occur on its external face. The joint consists of two half sections (15) having a rigid support (25) fitted with a semicircular notch (30) containing the elastically deformable material (Styrene-Ethylene-Butylene-Styrene) in which are cutouts forming the slots when the faces of the half joints are clamped together.
