Abstract (en)
[origin: WO0155544A1] A blind (50) comprises a plurality of blind slats (52), each of which is pivotally coupled <i>via</i> a linkage (56) to a support member (55). Each linkage (56) is pivotally coupled to a reciprocating member (58), the position of which determines the orientation of the slats (52) to the support member (55). Each slat (52) is configured to pivot about an axis located to one lateral side (52A) of the slat. In this way, the reciprocating member (58) may be housed within the support member (55).
