Abstract (en)

[origin: WO0157366A1] According to the invention, the thermal load to which a turbine (4) is subjected is kept within an acceptable range by monitoring the change in temperature (T) of the medium that is supplied to the turbine (4), especially fresh steam, over time. An emergency trip for the supply of fresh steam to the turbine (4) preferably takes place if a maximum temperature gradient ($dT/dt(\max)$) is exceeded.
