Abstract (en)
[origin: US6467711B2] A device for the size reduction of foodstuffs, such as onions and the like, with a housing which may be turned over the goods to be reduced in size. A knife is displaceable downwards against a force of a spring by an actuation mechanism with a push button and a plunger. The knife with the upwards movement by the guiding in the housing is rotated about an angle and by way of a positive displacement the rotation of the actuation mechanism relative to the housing is limited in one direction. The actuation mechanism includes a cap open at the bottom in which the push button is rotatably mounted, wherein the push button and the cap in the axial direction are rigidly connected to one another. An outer shaping of the actuation mechanism is completely free with the application of the cap.
