Abstract (en)

[origin: EP1255001A2] The device for blowing insulating material into insulation chambers in walls, ceilings and roofs comprises a blow-in hood (1), a pressure device (20) and a levelling device (30). The levelling device has a material suction arrangement. The complete equipment is arranged on a mobile support frame (50), the pressure device being between the hood and the levelling device. The three constituents are movable relatively to each other on the frame, particularly on a rotatable disk or a rotatable frame. The blowing hood is connected to a mobile material reservoir (81) and an air suction device (9) for removal of air from a material chamber (12) whilst material is being blown into it.
