Abstract (en)

[origin: EP1255165A2] A coating system of the present invention includes a bath storing a coating liquid for coating conductive cores. An end processing device removes films formed on the end faces of the cores coated with the coating liquid. At least two elevation devices are mounted on a single rotatable shaft each for gripping the cores and selectively raising or lowering the cores. Cores to be coated and cores to be processed by the end processing device are replaced in position with each other to thereby effect coating and end face processing in parallel. <IMAGE>
