Abstract (en)

[origin: WO0160197A1] The invention concerns an appliance for removing body hair comprising a roller (5) mounted rotatable in a housing (1) designed to be hand-held, said roller comprising at least two tweezers (5a, 5b) designed to squeeze and pull out hairs, the roller being adapted to be driven in rotation by an electric motor (8) via a transmission system (12). More particularly, the invention is characterised in that the assembly formed by the roller, the transmission system and the motor is divided into two parts, each part being integral with a support (11a, 11b) mounted floating relative to the housing and being driven in vibration at a predetermined frequency, the vibration frequency of one of the parts being in one hundred and eighty degree phase shift relative to the other part.
