Abstract (en)  
A device (1) for the differentiated collection of rubbish comprises a container (2) divided into housing compartments (11, 12) each having a loading opening (18, 19) for rubbish insertion and an outlet opening (12, 13) for rubbish ejection. The housing compartments (11, 12) have mutually diverging inner surfaces so that rubbish emptying from the container (2) is facilitated. Further in engagement with the container (2) is a loading unit (3) equipped with appropriate pushers (22, 23) for insertion of the rubbish into the housing compartments (11, 12) through the respective loading openings (18, 19). The pushers (22, 23) are made in such a manner that the rubbish is directed towards a central region of the housing compartments themselves. <IMAGE>
