Abstract (en)

[origin: EP1256645A1] A flat knitting assembly has a guide bed (300) for knitting needles or mesh transfer elements. The needles rest in grooves (110) within the guide bed. One or more of the guide beds (300) is transversely subdivided into two (100, 200) at an interface point (150) that does not interrupt the pattern of grooves (110). When the two parts (100, 200) are end-to-end all the longitudinal grooves are at the same lateral intervals. All guide bed (300) parts (100, 200) can move longitudinally together or individually. The separation interfaces (150) are positioned between the guide bed (300) parts (100, 200). The guide bed parts have a toothed interface line.
