Abstract (en)

[origin: EP1258685A1] The carriage (11) is pulled out by a spring (13) and run back in by the spring using less force than even for partial withdrawal. The withdrawal force of the spring (15) is reduced by a linkage (22) when the carriage is run in, the linkage composed of levers (22-26) forming an approximate rectangle. The first diagonal (29) of the rectangle runs parallel to the withdrawal direction (15) as against a second diagonal (28) which houses a tensile spring (29) used to tension the linkage levers. The oven door is held closed by the force of the spring (13) by element (18) which in turn is reduced in power by the actuating unit (20) when opening the door.
