Abstract (en)

[origin: DE10010462A1] The condition interrogation method uses a special communications peripheral (VPG1) associated with the subscriber group (CXGRP), which is connected to a branch exchange device (VST1), coupled via at least one further branch exchange device (VST2) to at least one terminal and/or communications peripheral (TLN2-TLN4) of the subscriber group. The condition interrogation of the subscriber terminal and/or the communications peripheral is effected via a signalisation path (ZK) between the second branch exchange device and the first branch exchange device.
