Abstract (en)

[origin: DE10011178A1] The speech-activated control method uses a training phase for entering a limited number of spoken commands in a speech recognition device by the user, each corresponding to a required action, with subsequent analysis of the spoken commands to provide reference speech patterns for each of the actions, which are stored for comparison with spoken commands provided during the operation of the electrical device. The speech recognition device can be used for operation of the device by more than one user by entering a reference vocabulary for each user which is analysed for correct identification of the spoken commands.
