Abstract (en)
[origin: DE10009350A1] The invention relates to a circuit arrangement and corresponding method, whereby data, coming from various networks and destined for various terminals of a user, or data from terminals of a user, destined for targets in various networks are copied, without delay, to a common transmission interface (SDSL).
[origin: DE10009350A1] The system forms an ATM cell flow on an SDSL frame interface contg. a TDM-IOM2 converter. A IOM2 interface is used as a clock source to transport the ATM data with the same clock with which the data of the primary data flows combined with the IOM2 interface are synchronised.
