Abstract (en)

[origin: WO0166879A1] A method for erecting a scaffold, wherein on a ground surface, substantially in a grid, at least two rows of posts are disposed, the posts being arranged on junction points of said grid, such that at least directly above said ground surface, at least between in each case two posts in a row, there is a fixed, at least predetermined distance, the posts extending vertically and comprising bases, said bases each comprising, on or at least adjacent the end facing upwards during use, a first coupling element for coupling to a complementary second coupling element, connected to a relatively smooth scaffold tube of a traditional scaffolding system, whereupon, on the basis of said scaffold tubes with at least further relatively smooth scaffold tubes and scaffold clamps, a scaffold is erected, while the bases further each comprise at least one third coupling element, compatible with a system scaffolding system, whereby in each case two juxtaposed bases in a row are intercoupled by a system horizontal member of the relevant system scaffolding system.
