Abstract (en)

[origin: DE10012409A1] The actuator is designed to allow more convenient verification of the functional capability of the control circuits without having to first assemble the individual units for driving the actuator. A second controller (26), for controlling the pressure or quantity of the pressure medium supplied to the actuator (13), is arranged in the same housing as the controller (15) for the position of the valve piston.

[origin: DE10012409A1] The actuator is designed to allow more convenient verification of the functional capability of the control circuits without having to first assemble the individual units for driving the actuator. A second controller (26), for controlling the pressure or quantity of the pressure medium supplied to the actuator (13), is arranged in the same housing as the controller (15) for the position of the valve piston.
