Abstract (en)

[origin: WO0155911A1] A system and method of performing genomic research via online analysis of genomic data objects. A novel technical information model and implementation facility combines genomic visualization and analysis tools with the ability to link genomic data objects across (and within) plural databases. This provides for interactivity that is not possible using conventional Internet access processes and also provides for data integration that further enhances the effectiveness of genomic research. A business process controls how the databases are accessed, particularly the commercial fee-for-access databases, so that the researcher using a system according to the invention need not be concerned with keeping track of access limitations.
