Abstract (en)

[origin: WO0075875A2] The invention concerns computer-assisted ticketing systems with multiple operators, which consists in providing the stations (103) enabling access to services (telephone or banking or public transport), with means (106), called consulate for separately processing data read on a ticket (105) issued by another operator. The links between the consulate and the validator are reduced to a minimum so that the data concerning the ticket validation processing cannot be known by one or the other of the operators. It enables to provide interoperability through safe, discreet and decentralised means.
