Abstract (en)

[origin: WO0154381A2] A wireless communication device (100) may include a display (122), an incoming-call alert device (130), a call processor (128) and other features. A scheduler (126) selectively generates control signals to provide for intelligent control of the manner of operation of the features of a wireless communications device (100). In one embodiment, a receiver (110) receives a time-related data message from a remote location to set a timer (124) with the current time, including the date. The current time is compared with predetermined time-periods and the scheduler (126) generates alternate control signals to control the features during predetermined time-periods.
