Abstract (en)

[origin: WO0170466A1] The invention relates to a tool comprising an, in particular, tubular shaft (1) and a handle for a user's hand (5). Said handle can be fixed in various axial positions and/or radial positions on the shaft and is provided essentially in the form of a closed sleeve (6). The sleeve stores a manually actuatable clamping piece (8) that can be adjusted between a clamping position, in which the handle engages with the shaft in a non-positive manner, and a disengaging position, in which a relative movement between the handle and shaft is permitted. According to the invention, the clamping piece, in the clamping position thereof, verges with its outer surface into the outer surface of the sleeve in an essentially flush manner.
