Abstract (en)
[origin: WO0169525A1] In a package for protecting and displaying goods, the package includes a wireless smart package assembly and a Radio Frequency Identification (RFID) tag. The assembly comprises a package having at least one sheet of material adapted to support a product during the shipment and storage of the product. An electrically conductive material distributed along a portion of the sheet so as to form a non-planar antenna. The non-planar antenna may be configured to form a corner antenna or an array of spaced-apart dipole antennas. The invention when used with a passive RFID tag includes a power source within the RFID tag that allows for a one-time transmit capability.
