Abstract (en)

[origin: FR2819964A1] The aim of the invention is to improve the cost-effectiveness of the Aeronautical Telecommunications Network (ATN), by means of a method for submitting connection requests, received via an ATN network from non-ATC applications, to a validation of the requested addresses, by means of two availability tables which are updated and located in the terminal hosting the applications requesting the connections. One of said tables relates to the availability of local applications and is used to inform the remote terminals. The other table relates to the availability of remote applications and is used to validate the connection requests from local applications.
