Abstract (en)
A pallet for supporting freight, goods or other materials is transportable by a lifting mechanism and comprises a plurality of first segments (10) made of a synthetic material and having a substantially oblongness form defined by a longitudinal edge (1) and a narrow edge (2). The first segments (10) have upper surfaces defining a supporting plate (3). Each of the first segments (10) comprises at least two openings (11) extending in transverse direction thereof. The first segments (10) are arranged side by side in such a way that the openings (11) are in alignment and define a passage. A rod (30) is introduced into the respective passage and is provided with fastening means (31, 32, 33, 34) at its respective ends for fastening the first segments (10) therebetween. Such a pallet has a modular design, which allows an easy and quick assembly of the pallet in different dimensions.
