Abstract (en)  
The dispenser consists of a container (1) for a fluid product (10), a distributor (2) in the form of a pump or valve set in a top aperture (15) and operated by a pusher (5) and rod (25). The container is fitted inside a decorative outer casing (6) through its open base (61) with a cover (62), with the pusher held inside the casing so that it cannot be disconnected from the rod (25). When the container is inserted in the casing the pusher fits through an aperture at the top of the casing which allows it to move in an axial direction.
