Abstract (en)

[origin: EP1266987A2] To set up a loom, specific data for the fabric to be woven are gathered for a patterning loom (1) and are stored, to control the loom operation. Mechanical data specific to the loom are gathered and stored, and similar data are established for other looms (X1,X2) to weave the same fabric, to be compared with the stored data. <??>To set up a loom, specific data for the fabric to be woven are gathered for a patterning loom (1) and are stored, to control the loom operation. Mechanical data specific to the loom are gathered and stored, and similar data are established for other looms (X1,X2) to weave the same fabric, to be compared with the stored data. The control (2) uses the mechanical and a fabric data to transmit control signals through a circuit (4) to the controls (3) of the other looms, to operate their weaving systems for the required weave.
