Abstract (en)

[origin: WO0170823A1] A rod type polymer preform with radially-varying properties, e.g., refractive index, which is useful for preparing a contaminant-free high-bandwidth graded-index plastic optical fiber (GI-POF) or optical rod lens, can be conveniently prepared by a method which comprises charging a reactive material into a cylindrical reactor, inducing a chemical reaction while rotating the cylindrical reactor, and repeating the charging and reaction procedure two or more times using chemically or compositionally different materials in each of the repeating step.
