Abstract (en)
[origin: WO0173361A1] The invention relates to a refrigeration device (10) comprising a storage compartment (22) which is mounted on rollers and can be pulled out of the housing (11) of the refrigeration device. The problem with known refrigeration devices (10) is that the storage compartment (22), after being pulled out approximately halfway, opens independently to its full extent, colliding audibly with an end stop. To prevent an inadequacy of this type, the invention is characterized in that the guide tracks (35) are configured as two oblique planes (36) of differing lengths that are interconnected, whereby the longer oblique plane causes the storage compartment to close independently.
