Abstract (en)

[origin: WO173368A1] The invention relates to an adjusting device for small arms, comprising a clamping device (10 to 14) for fixedly clamping the small arm tight. The invention provides that the clamping device (10 to 14) is moveably guided on a bent path with two leaf springs (8, 9), the rear leaf spring (9) being arranged at an angle, in order to simulate a natural recoil movement when a shot is fired. The two leaf springs (8, 9) support the clamping device (10 to 14) against the recoil that occurs when a shot is fired. The inventive adjusting device produces an extremely natural recoil movement of the small arm such as that which occurs when an aiming shooter stops the small arm during the firing of shots.
