Abstract (en)

The roller itself (6), in its axial orifice (9) for coupling to shaft (10), incorporates an intermediate perimetral ribbing (12) which acts as a spacer for the conventional pair of bearings (11-11'), so that the external bearing (11) is mounted on the external end of orifice (9) and is axially retained by the flange (13) on the end of shaft (10), while the inner bearing (11') is mounted on the inner face of the roller and is axially pressed against spacer (12) by a washer (14) which in the assembled configuration of the roller on the roller-bearing carriage rests laterally on the arm of said carriage while retaining it in an axial sense. <IMAGE>
