Abstract (en)
[origin: EP1270964A2] The device for the adjustable fixture of an apparatus involves a holder directly formed on the housing of the apparatus and provided with a fixture flange component. A tension screw (3) enables different angle positions to be fixed between the apparatus holder and the surface of the flange component. On the counter side of the flange surface of the flange component (1) is a dome (7) with a tapped hole in its axial direction. A disk-shaped adjustment component (2) is provided with a diametrical slot (15). The width of the slot corresponds to the shaft diameter of the tension screw and the locating surface (17) for the head of the tension screw is curved in the direction of the slot.
