Abstract (en)

[origin: WO0168827A1] A process for the production of physiologically-active human interferon alpha from genetically engineered yeast, *Pichia pastoris*, comprising digesting, with an enzyme to produce a linearized plasmid, a plasmid having a promoter and operationally linked to a human interferon alpha gene in the absence of a fusion region; transforming *Pichia pastoris* cells with the linearized plasmid by homologous recombination to form *Pichia pastoris* clones; screening the *Pichia pastoris* clones for high interferon alpha expression to find a high interferon-yielding *Pichia pastoris* clone; growing the high interferon-yielding *Pichia pastoris* clone; and purifying physiologically-active human interferon alpha protein from the high interferon-yielding *Pichia pastoris* clones.
