Abstract (en)
[origin: CA2404344A1] This invention is a method, and apparatus for an aerosol chamber (300) havin g an input opening (343), with back pressure created in the chamber by an aperture barrier (360), such as a disk having a plurality of concentric, and circumferential disposed sets of openings (361) to reduce the size of particles applied at the input opening before leaving the output opening (320); which is of lesser diameter than the input opening, which extends to the input opening by an arcuate surface of revolution that serves to redirec t interiorly of the chamber aerosol particles that have entered the chamber, a nd reached the surface of revolution.
